DIEBOLD SECURITY

DIEBOLD INTRODUCES INTUITIVE ONLINE SECURITY MANAGEMENT WITH LAUNCH OF SECURESTAT

Diebold creates powerful, easy-to-deploy, secure, native web-based security management tool to serve as single gateway for connecting and managing systems, enabling security services and information

NORTH CANTON, Ohio -- During ISC West 2013, April 10-12 in Las Vegas, Diebold, Incorporated (NYSE: DBD) will introduce new technology that will enable end users to integrate systems and connect services to streamline and centralize the management of security operations online from wherever they are.

SecureStat® from Diebold is an innovative online security management tool that unifies security services and disparate systems, while providing a single interface for real-time administration of security operations across an enterprise. At the heart of Diebold's SecureStat is a personalized dashboard that utilizes customizable, distinct widgets to provide a snapshot of a user's entire security platform, including locations, security systems and devices.

"Our experience as a services-driven security solution and monitoring provider has brought valuable insight into the key attributes, functionality and operational ease our customers desire when managing their security platforms. Our technology was architected with these experiences in mind," said Jeremy Brecher, vice president, technology, electronic security, Diebold. "We were committed to building it right, leveraging modern web services technology to deliver a seamless, powerful user experience that enables services and truly unifies security across the enterprise."

Because of its robust systems interoperability, SecureStat enables seamless integration of existing hardware, software, monitoring and other managed services. That approach means customers can leverage the equipment manufacturers of their choice, and they can connect all of their security products and services within a single, online management interface. As organizations evolve security, SecureStat is also flexible enough to allow rapid migration to future technologies.

Diebold has invested in building the infrastructure to support and sustain its online security management solution. That infrastructure was developed using open architecture for maximum flexibility to securely connect multiple security systems and services throughout the customer's security operation. SecureStat is fully scalable to the scope and function of the end user's organization, regardless of size and geographic reach.

With a robust portfolio of remote, hosted and managed security services, Diebold anticipates

immediate benefits for customers that implement SecureStat. The solution is being offered as a value-add to Diebold security services customers. In addition to connecting systems and services within a customer's security operation, SecureStat also provides users with a personalized, web-based portal – or dashboard – that provides a snapshot of all locations, systems and devices. The portal makes an end user's security operation accessible regardless of platform – computer, smartphone or tablet – or location.

"SecureStat continues Diebold's innovation and is a significant step in revolutionizing how users manage their security platforms and locations," said Tony Byerly, executive vice president, electronic security, Diebold. "By moving from system-specific connectivity toward product agnostic security-wide solutions, we're creating an interactive platform to deliver services within customers' existing security infrastructure. Customers will see real value when they begin to connect multiple systems and information that can be centrally managed and shared." SecureStat will be demonstrated throughout ISC West 2013 in Diebold's exclusive meeting space in the Venetian Las Vegas.
